HRNOVA PAYROLL · ONE-TIME SETUP

Tax Opening Balance

Tell HRNova how much income was taxed, and how much tax was already deducted, before it started. You only need your payslips.

WITHOUT OPENING BALANCE

HRNova thinks no tax was paid yet

Monthly tax comes out wrong, and the employee may face a big deduction later.

WITH OPENING BALANCE

HRNova spreads what is left over the months left

Monthly tax stays correct and matches what HR calculates.

3 steps

1

Open the payslips

Take every month from the start of the fiscal year until HRNova began (for example July to September).

2

Add up the months

Work out two totals for each employee: Taxable Income and Tax Deducted.

3

Upload one row each

One row per employee, with the totals of all months together.

How to get the two totals

TAXABLE INCOME

Taxable salary + company insurance, for each month, added together

Taxable salary = the pay heads your company marks as Taxable in salary setup.

TAX DEDUCTED

The Tax amount printed on each payslip, added together

Copy from the payslip. Do not estimate.

Example: one employee, July to September

Month	Taxable salary	Company insurance	Taxable income	Tax on payslip
July	81,312	1,543	82,855	328
August	81,312	1,543	82,855	328
September	81,312	1,543	82,855	328
Total			**248,565**	**984**

In this example the company treats Medical (5,808) as not taxable, so taxable salary is 87,120 - 5,808 = 81,312. Your company's setup decides which heads count.

What goes in the file

Employee	Year	Taxable Income	Tax Deducted
H000002	2026	**248565**	**984**

Year is the year the fiscal year started. July 2026 to June 2027 is 2026. Use plain numbers, no commas.

Do

Enter the total of all months together.

Use the full salary. Ignore absence deductions.

Use the same Year on every row.

Do not

Enter one month's income when the row covers three months. (82,855 instead of 248,565 gives the wrong tax.)

Include a month that already has a payroll in HRNova, even a rough one. It would be counted twice.
